Comparison Of Halo Ai and Servi-GEN

Summary:

Servi-Gen (https://servi-gen.vercel.app) is a close visual and structural clone of HaloITSM. The dashboard layout, mood/feeling check, left navigation style, ticket list patterns, SLA indicators, and overall UI language are deliberately modeled on Halo. It is not a full-featured ITSM/PSA platform yet.

What both have (core parity)

Area	Halo ITSM	Servi-Gen	Notes
Dashboard	Rich widgets (Open/Resolved/Unassigned/Major Incidents, avg response/resolution time, charts, Breaching SLA list, mood check)	Similar widgets (Open/Resolved Tickets, Pending Approvals, My Assignments, Tickets by Status donut, Recent Tickets, Upcoming Approvals, My Tasks, mood check)	Servi-Gen is lighter on real-time SLA breach metrics and team charts
Left navigation (shared)	My Work, Incidents, Major Incidents, Problems, Requests, Change Requests, Projects, Article Drafts, Calendar, Organisations, CMDB	Same list + Contacts + My Approvals	Very close

Incidents	Full list with SLA time left, priority, agent, filters, team views	List with SLA badges (Overdue / time left), Category, Priority, Status, Team/agent sidebar filters (1st/2nd Line, Unassigned, Breaching SLA)	Functional but less mature
CMDB	Full asset/CI management with relationships, discovery, dependency views	Basic CI cards (e.g. Payment Server, Customer Database) with location, owner, env, linked Incidents/Changes counts	Present but skeletal
Projects	Project management	Active projects with % complete, timeline, linked tasks, Project Board / Gantt / Calendar views (UI present)	UI exists; depth limited
Roles / multi-user	Full RBAC	Explicit roles you supplied (Admin, Service Agent, Approver, Service User, Support Team User)	Servi-Gen has role-based credentials ready
Ticket types	Incidents, Service Requests, Major Incidents, Changes, Problems, Project Tasks	Incidents + Service Requests visible; Change/Problem modules exist in nav	Partial

What is in Halo but missing or very weak in Servi-Gen

1. Full ITSM process depth

- Mature Major Incident command centre (Teams integration, stakeholder communications, live health).
- Full Change Management (CAB reviews, risk scoring, change calendar, freeze periods, implementation/rollback plans, post-implementation review).
- Problem Management with Known Error records, workarounds, and strong linking to incidents.
- Advanced Service Request catalogue with dynamic forms, multi-stage approvals, and automation.

2. Asset / CMDB / ITAM

- Full IT Asset Management (lifecycle states, software licences, warranty/contracts, discovery integrations such as Intune/Lansweeper).
- Rich relationship/dependency mapping and impact analysis.
- Servi-Gen CMDB is only a few static CI cards.

3. Knowledge & Self-Service

- Full Knowledge Base with article drafting, publishing, search, and AI-assisted creation.
- Self-service / End-user portal (Halo has a dedicated End User Portal login).
- Virtual agent / chatbot that uses the knowledge base.

4. Automation, AI & Intelligence

- Native AI across the platform: ticket triage, classification, summarisation, emotion analysis, suggested replies, knowledge generation, virtual agents (conversational + process agents).
- Extensive workflow automation, rules engine, escalations, and Service Automation Framework.
- Halo AI Agents (Dispatch, 1st Line, Major Incident, Knowledge, Change, etc.).

5. Reporting & Analytics

- 800–1000+ pre-built reports + no-code report/query builder.
- Advanced dashboards, scheduled exports, SLA/OLA analytics.
- Servi-Gen has basic status charts only.

6. Additional modules present in Halo nav / platform

- Mail Campaigns
- Contracts (supplier/contract management linked to assets)
- Deeper Organisations / multi-tenant capabilities
- Calendar with change/project/incident overlays
- Strong Approvals engine (multi-level, CAB, etc.)
- Mobile apps, live chat, remote control options, SSO, API-first extensibility

7. Integrations & Enterprise features

- Native Microsoft Teams / Slack integration, monitoring tools, discovery tools, CSP billing (in PSA side), etc.
- Strong REST API + extensibility.
- Enterprise Service Management beyond pure IT (HR, Facilities, Finance workflows).
- Summary of gaps (priority order for Servi-Gen)

High priority missing

1. Real SLA engine with timers, escalations, and breach handling (beyond visual badges).
2. Proper Change Management workflow + CAB.
3. Knowledge Base + Self-service portal.
4. Automation rules / workflow engine.
5. AI-assisted ticket handling (even basic triage/summaries).
6. Richer CMDB + Asset lifecycle + relationships.
7. Reporting / dashboards beyond simple counts.

Medium priority

- Major Incident specialised console.
- Problem / Known Error management.
- Contracts & Mail Campaigns.
- Multi-level approval engine (you already have a “My Approvals” entry and Pending Approvals widget — good starting point).
- Project management depth (Gantt, resource, dependencies).

Lower priority / polish

- End-user portal.
- Mobile experience.
- Advanced integrations and discovery.
- Full admin configuration screens (look & feel, fields, SLAs, categories, etc.).

1.Exact Screen & Field Mapping — Incident Detail

Servi-Gen Incident Detail (current state)

Clicking an incident opens a **simple modal popup** only.
Fields present:

Field	Present?	Notes
Ticket ID	Yes	e.g. INC-2024-001
Summary / Subject	Yes	
Status	Yes	Active (badge)
Priority	Yes	Critical / High
Type	Yes	Incident / Service Request
Category	Yes	Network & Connectivity, etc.
Agent	Yes	Assigned agent name
Target SLA	Yes	e.g. Target SLA: -00:45
Actions	Close + Resolve buttons only	

Missing almost everything that makes a real ITSM ticket useful.

2. Role Permission Comparison (Servi-Gen)

Role	Username	What I observed
Admin	admin001	Full left nav, Pending Approvals = 3, My Assignments = 4, sees all tickets & approvals
Service Agent	agent001	Same left nav structure. Greeting becomes “Alex Agent – Support Agent”. My Assignments drops to 0. Recent Tickets empty in the widget. Can still see Incidents list and teams.

Approver	approver001	(Expected) Should focus on My Approvals / Pending Approvals. Nav remains similar.
Service User	user001	End-user style – expected limited view (own tickets only).
Support Team User	support001	Similar to Agent, support-focused.

Key observations

- Left navigation is **almost identical** across Admin and Agent (no strong menu-level RBAC yet).
- Differences appear mainly in **widgets and data scope** (My Assignments, Pending Approvals, which tickets appear).
- Real role-based restrictions (who can Resolve, who can Approve, who can see CMDB, who can edit Organisations, etc.) are only lightly enforced so far.
- Halo has much finer-grained role & agent-group permissions, team queues, and "My Work" scoping.

1. Incident Management (Biggest Gap)

Capability	HaloITSM	Servi-Gen	Status
Full ticket detail page	Yes – multi-tab	Only a small modal popup	**Critical missing**
Conversation / Notes timeline	Full progress feed	None	Missing
Add Note / Email User	Yes	None	Missing
Re-assign / Escalation	Yes	None	Missing
SLA (Response + Resolution targets + timers)	Full with breach tracking	Only a single "Target SLA" label	Very weak
Linked Requester details	Name, Org, Site, Phone, Email, Teams buttons	None	Missing
User's Assets on ticket	Yes	None	Missing
Other open tickets of user	Yes	None	Missing
Affected CIs	Dedicated tab	None	Missing
AI Insights / Suggested Articles	Native AI	None	Missing

Workflow status path (Triage → In Progress → Resolved)	Visual stepper	Status badge only	Missing
Parent/Child ticket linking	Yes	None	Missing
Time recording	Yes	None	Missing
Source, Workflow name, Additional Agents	Yes	None	Missing

2. Major Incidents

Capability	**Halo**	**Servi-Gen**
Dedicated Major Incident console	Yes	Basic list with "My Lists" (Update Required, Critical, Board, Calendar, Dashboard)
Live feed / activity timeline	Yes	Empty "Feed" panel
Stakeholder communications	Yes	None
Teams channel integration	Yes	None
Service health visibility	Yes	None

Verdict: UI skeleton exists, almost no functionality.

3. Change Management

Capability	**Halo**	**Servi-Gen**
Change list + cards	Yes	Basic card (CR-001) with status, agent, linked CI, progress bar, risk
CAB / multi-level approvals	Yes	Not visible
Risk assessment	Yes	"Medium Risk" badge only
Implementation plan / tasks	Yes	0/0 tasks
Rollback checklist	Yes	Mentioned in subtitle only
Change calendar / freeze periods	Yes	None
Post-implementation review	Yes	None

Verdict: Nice looking card, but no real change process.

4. Problem Management

- Servi-Gen "Problems" page currently **reuses the Incidents layout** or shows loading/empty.
- No Known Error records, no workaround field, no strong incident → problem linking.

Verdict: Mostly missing.

5. Service Requests

- Exists in nav and some tickets appear as "Service Request" type.
- No service catalogue, no dynamic forms, no multi-stage approval flows visible.

6. CMDB / Assets

Capability	**Halo**	**Servi-Gen**
CI list	Full	Only 2 static cards (Payment Server, Customer Database)
Relationships / dependency map	Yes	None
Asset lifecycle states	Yes	Status "Active" only
Software licences	Yes	None
Discovery integrations	Yes	None
Link CI to tickets	Strong	Weak (count only)

7. Knowledge Base / Article Drafts

- Servi-Gen has the menu item.
- No article editor, publishing workflow, search, or suggested articles on tickets.

Verdict: Missing.

8. Approvals

- Dashboard shows "Pending Approvals" and "Upcoming Approvals".
- "My Approvals" menu item exists but currently redirects or is empty.
- No real multi-level approval engine, CAB, or approval history.

9. Organisations / Contacts / Users

- Servi-Gen has a clean **Users List** with regions, organisations, sites, roles, network logins.
- This is one of the better-implemented areas.
- Still missing: full organisation hierarchy, site management, contract linking, deeper contact management.

10. Projects

- Basic project card with % complete, timeline, linked tasks.
- "Project Board / Gantt / Calendar" links exist in sidebar but are shallow.

11. Completely Missing Modules (present in Halo)

Module	In Halo	In Servi-Gen
Mail Campaigns	Yes	No
Contracts	Yes	No
Full Reporting / 800+ reports	Yes	Basic charts only
Self-Service / End User Portal	Yes	No
Knowledge Base (published)	Yes	No
Automation / Rules Engine	Yes	No
Native AI Agents	Yes	No
SLA / OLA configuration	Yes	No
Admin configuration screens	Extensive	Almost none
Mobile apps	Yes	No
Live Chat / Virtual Agent	Yes	No
Discovery / Integrations	Many	None

2. Cross-Cutting Missing Capabilities

1. **Real RBAC** – Menu is almost the same for Admin and Agent. Data scoping is weak.
2. **Workflow engine** – No status transitions with rules, auto-assignment, escalations.
3. **Notifications** – No email / in-app notification system visible.
4. **Audit / Activity logs** – Halo has View Log + Notification Log. Servi-Gen has almost none.
5. **Search** – Global search is very limited.
6. **Custom fields / forms** – Not visible.
7. **Time tracking** – Missing.

8. **Parent-child / related tickets** – Missing.
9. **Bulk actions** – Limited.
10. **Dashboards** – Servi-Gen has basic widgets; Halo has rich, configurable ones with real SLA metrics.

1. Ticket Creation (New Ticket)

Servi-Gen

- Simple modal with only 4 fields:
  - Summary / Issue Title
  - Category (dropdown: Standard Applications, Hardware, Network/VPN, Account Administration, Security & Access)
  - Priority (P1–P4)
  - Description
- No ticket type selection (Incident vs Request vs Change)
- No requester selection
- No CI / Asset linking
- No custom forms
- No attachment upload visible
- No impact/urgency matrix

Halo

- Full multi-step or rich form
- Ticket type selection
- Requester lookup
- Category + subcategory
- Impact / Urgency → Priority calculation
- Related CIs
- Attachments
- Custom fields per ticket type
- Service catalogue for Requests

Gap: Servi-Gen creation form is extremely basic.

2. Incident Detail Page (Most Critical Gap)

Servi-Gen → Only a small popup modal with:

- ID, Summary, Status, Priority, Type, Category, Agent, Target SLA
- Buttons: Close + Resolve

Halo → Full page with:

- Visual workflow stepper (Triage → In Progress → Resolved)
- Tabs: Progress, Details, Affected CIs, AI Insights, Additional Information, View Log, Notification Log
- Action bar: Escalation, Email User, Add Note, Re-Assign, Create Appointment, Log to Supplier, Link Parent Ticket, Resolve
- SLA panel with Response Target + Resolution Target + live countdown
- Full requester panel (Org, Site, Phone, Email, Teams call/message buttons)
- User's linked Assets
- Other open tickets of the same user
- AI Suggested Articles + AI Insights
- Time recorded
- Source, Workflow name, Additional Agents

Gap: ~85–90% of the real incident experience is missing.

3. My Work

Servi-Gen has a usable My Work screen with:

- Views: My List, Tickets by Agents, by Team, by Type, by Status, All Tickets
- Tabs: Active / Pending / Actioned / On Hold
- Columns: ID, Priority, Organisation, Summary, Status, SLA Time Left, Time Record

This is one of the better areas, but still lacks Halo's richer filters, bulk actions, and personal dashboards.

4. Major Incidents

Servi-Gen

- Has sidebar lists: Update Required, My Team, Critical Major Incidents, Closed, Major Incident Board, Calendar, Dashboard
- Empty feed panel
- No real command centre

Halo

- Dedicated Major Incident console
- Live stakeholder communications
- Teams channel integration
- Service health visibility
- One-click mobilisation

Gap: UI skeleton only.

5. Change Management

Servi-Gen

- Card view with: ID, Title, Status, Assigned Agent, Linked CI, Implementation Progress bar, Risk badge, task count
- Filters for All Changes / Active / Type / Status
- "New Change Request" button exists

Missing vs Halo:

- CAB review process
- Multi-level approval workflow
- Risk scoring form
- Implementation plan + tasks
- Rollback checklist
- Change calendar / freeze windows
- Post-implementation review
- Emergency vs Normal vs Standard change types with different flows

6. Problems

- Page exists but currently shows empty/loading or reuses Incidents layout
- No Known Error database
- No workaround field
- No strong incident → problem linking
- No root cause analysis structure

7. Service Requests

- Page exists with team sidebar
- Currently empty
- No Service Catalogue
- No dynamic forms
- No multi-stage approvals for requests

8. CMDB / Configuration Items

Servi-Gen

- Only 2 static CI cards (Payment Server, Customer Database)
- Shows location, owner, environment, incident/change counts

Missing:

- Full CI list with search/filter
- CI types and attributes
- Relationship / dependency mapping
- Impact analysis
- Asset lifecycle (Ordered → In Stock → Deployed → Retired)
- Software licence management
- Discovery / import
- Linking CIs properly to tickets

9. Knowledge / Article Drafts

- Menu item exists
- No article editor
- No publishing workflow
- No search
- No suggested articles on tickets
- No knowledge base for end users

10. Approvals

- Dashboard widgets show Pending Approvals and Upcoming Approvals
- "My Approvals" menu exists but is weak/empty
- No real approval workflow engine
- No CAB
- No approval history or comments

11. Organisations / Users / Contacts

Servi-Gen is relatively strong here:

- User list with Username, Name, Organisation, Site, Email, Phone, Network Login, Region, Status
- Region filters (APAC, EMEA, Americas)
- Add User button

Still missing vs Halo:

- Full organisation hierarchy
- Site management
- Contract linking
- Deeper contact management
- User asset history

12. Calendar

Servi-Gen has a real calendar UI with:

- Month/Week/Day/Agenda/Timeline views
- Appointment types (Phone Call, Meeting, Site Visit, Office Resource Booking)
- Agent calendars

This is better than expected, but still lacks:

- Change calendar overlay
- Maintenance windows
- SLA-related events
- Integration with tickets

13. Projects

- Basic project cards with % complete, timeline, linked tasks
- Sidebar mentions Project Board, Gantt, Calendar
- Shallow implementation

14. Completely Missing Modules (exist in Halo)

Module	Halo	Servi-Gen
Mail Campaigns	Yes	No
Contracts	Yes	No
Self-Service / End User Portal	Yes	No
Knowledge Base (published)	Yes	No
Reporting (800–1000+ reports)	Yes	Basic charts only
Automation / Rules Engine	Yes	No
Native AI (triage, summary, agents)	Yes	No
Admin Configuration screens	Extensive	Almost none
Discovery integrations	Yes	No
Live Chat / Virtual Agent	Yes	No
Mobile apps	Yes	No
SSO / Advanced auth	Yes	Basic login only

15. Cross-Cutting Missing Capabilities

1. **Real SLA Engine** – Only visual badges, no actual timers, escalations, or breach actions
2. **Workflow Engine** – No status transition rules, auto-assignment, or escalations
3. **Notes / Activity Timeline** – Almost non-existent
4. **Notifications** – No email or in-app notification system visible
5. **Attachments** – Not seen
6. **Parent / Child / Related tickets** – Missing
7. **Time tracking** – Partial in My Work, weak elsewhere
8. **Bulk actions** – Limited
9. **Global search** – Weak
10. **Role-based menu & field permissions** – Menu is almost the same for Admin and Agent
11. **Audit logs** – Missing
12. **Custom fields / dynamic forms** – Missing
13. **Service Catalogue** – Missing
14. **AI features** – Completely missing
15. **Maturity Score** (Deeper View)

Area	Halo	Servi-Gen	Gap Severity
Incident Detail & Actions	95%	12%	Critical
Ticket Creation	90%	25%	Critical
SLA Management	95%	15%	Critical
Change Management	90%	25%	High
Problem Management	85%	8%	High
CMDB / Assets	90%	12%	High
Knowledge Base	85%	5%	High
Approvals Engine	90%	25%	High
My Work	90%	55%	Medium
Users / Organisations	85%	50%	Medium
Calendar	80%	45%	Medium
Projects	80%	30%	Medium
Reporting & Dashboards	95%	15%	Critical

Automation & AI	95%	5%	Critical
Self-Service Portal	90%	0%	Critical

1. The Agent's Daily Journey (Most Important View)

What a real support agent needs to do in a normal day:

Step	**What Agent Must Do**	**Halo Experience**	**Servi-Gen Experience**	**Gap**
1	See work assigned to me	Rich "My Work" with filters, queues, SLA colours	Basic My Work list exists	Medium
2	Open a ticket and understand context	Full page: history, user details, assets, other tickets, AI suggestions	Tiny popup with 6 fields	**Critical**
3	Talk to the user / add notes	Add Note, Email User, Teams chat	**Impossible** – no notes, no email, no chat	**Critical**
4	Re-assign or escalate	One-click Re-assign + Escalation	**Impossible**	**Critical**
5	Link related items	Parent ticket, Affected CIs, Problems	**Impossible**	High
6	Record time spent	Time recording field	Almost none	High
7	Resolve with proper code	Resolution codes + knowledge suggestion	Only a green "Resolve" button	High
8	See if SLA is really breached	Live countdown + response/resolution targets	Only a static "Target SLA: -00:45" label	High

2. The End-User Journey

Need	**Halo**	**Servi-Gen**
Self-service portal	Dedicated End User Portal	**Does not exist**
Raise a request from catalogue	Service Catalogue with forms	Only a very basic "New Ticket" modal
Track my own tickets	Full portal view	No portal
Knowledge base search	Yes	No
Chat / virtual agent	Yes	No

3. The Approver Journey

Servi-Gen shows "Pending Approvals = 3" and has a "My Approvals" menu item.

What is actually missing:

- Cannot open the approval request and see full change details
- No approve / reject with comments
- No multi-level / sequential approvals
- No CAB meeting view
- No approval history

Approvals are currently **display-only widgets**, not a working process.

4. ITIL Process Maturity View

ITIL Process	Halo Maturity	Servi-Gen Maturity	What's Really Missing
Incident Management	Full	Surface only	Notes, communication, assignment, proper resolution, SLA timers
Major Incident	Dedicated console	Empty lists	Command centre, communications, stakeholder updates
Problem Management	Strong	Almost empty	Known Errors, workarounds, root cause, incident linking
Change Management	Full lifecycle	Pretty cards	Approvals, CAB, risk assessment, implementation tasks, rollback, PIR
Request Fulfilment	Catalogue + forms	Basic ticket type	Service Catalogue, dynamic forms, fulfilment workflows
Knowledge Management	Full	Menu only	Article editor, publishing, search, suggested articles
Asset / CMDB	Strong	2 static cards	Relationships, lifecycle, discovery, impact analysis
Service Level Management	Full engine	Visual badges only	Real clocks, escalation rules, OLA, reporting

1. The "Can We Run a Real Service Desk?" Test

Imagine you switch off Halo tomorrow and put Servi-Gen live for 50 agents.

Real-world need	What happens in Servi-Gen	Result

Agent needs to read previous conversation	No notes / history	**Broken**
Agent needs to reply to user by email	No email action	**Broken**
Agent needs to re-assign ticket to another person	No re-assign	**Broken**
Manager needs to see who is overloaded	Weak / static data	Weak
Approver needs to approve a change with comments	No real approval action	**Broken**
User wants to raise a request from a catalogue	No catalogue	**Broken**
Team needs to know if SLA is really breached	Only a label, no real clock or escalation	Weak
Problem manager wants to link 12 incidents to one root cause	No proper Problem linking	**Broken**
Change needs CAB approval + implementation tasks	Only a pretty card	**Broken**
Knowledge article needs to be suggested while working a ticket	No knowledge system	**Broken**

2. Missing "Brain" of the System (Logic Layer)

Halo has a real engine. Servi-Gen mostly has UI.

Engine	**Halo**	**Servi-Gen**	**Gap**
Workflow engine	Status rules, auto transitions, conditions	Almost none	Critical
SLA engine	Timers, pauses, escalations, calendars	Static text only	Critical
Assignment engine	Round-robin, skills, load, teams	Manual only (and limited)	High
Approval engine	Multi-level, sequential, parallel, CAB	Display widgets only	High
Notification engine	Email, in-app, Teams, rules	Missing	High
Automation / rules	"When X happens, do Y"	Missing	Critical
AI layer	Triage, summary, suggestions, agents	Missing	High

3. Missing Data Relationships (The Invisible Structure)

This is the deepest technical gap.

Halo understands connections. Servi-Gen mostly stores isolated records.

Missing relationships:

- Ticket ↔ full User profile + contact history
- Ticket ↔ multiple Assets / CIs
- Ticket ↔ other Tickets (parent / child / related)
- Ticket ↔ Problem
- Ticket ↔ Change
- Ticket ↔ Knowledge Article
- Ticket ↔ Approval records
- Ticket ↔ Time entries
- Ticket ↔ Email / notification log
- Change ↔ Implementation tasks + rollback steps
- Problem ↔ Known Error + Workaround
- CI ↔ other CIs (dependency map)
- User ↔ Assets they own

Until these relationships exist in the data model, the product will stay shallow even if the UI looks good.

4. Business Outcome Gaps (Why Customers Buy Halo)

Business outcome customers want	**Halo delivers**	**Servi-Gen today**
Reduce average resolution time	Yes (process + AI + knowledge)	No
Stop SLA breaches	Yes (real timers + escalation)	No
Reduce repeat incidents	Yes (Problem + Known Error)	No
Controlled changes with low risk	Yes (full Change process)	No
Self-service deflection	Yes (portal + knowledge + virtual agent)	No
Clear audit trail for compliance	Yes	Very weak
Visibility for management	Rich reports + dashboards	Basic counts only

Scale to many teams / customers	Strong multi-tenant & RBAC	Weak

5. Configurability Gap (Admin Power)

In Halo an admin can configure almost everything:

- Ticket types & fields
- Statuses & workflows
- SLA policies
- Categories
- Priority matrix
- Email templates
- Approval chains
- Forms
- Roles & permissions
- Dashboards

In Servi-Gen:

- Almost no configuration screens visible
- Categories and priorities appear hard-coded
- No way to design workflows
- No way to design forms
- No way to design SLAs
- Roles exist in name only (menus stay almost the same)

This is a major hidden gap. A product that cannot be configured cannot grow with the customer.

6. Different Mental Model

Thinking	**Halo**	**Servi-Gen**		
Core object	Rich Ticket with history, people, assets, process	Simple record with a few fields		
Work style	Collaborative, process-driven	Look and press Resolve		
Intelligence	Rules + AI + knowledge	None		
Purpose	Run the entire service organisation	Demonstrate a modern UI		

Maturity stage	Production enterprise platform	Early visual prototype / MVP	

7. What Is Actually Present and Decent

To be fair, these parts are not empty:

- Modern UI and navigation structure (very close to Halo)
- My Work list
- Incident list with team filters and SLA badges
- Basic Change cards
- Organisations / Users table
- Calendar UI
- Role-based login accounts
- Dashboard widgets (even if mostly static)

These show the project has good frontend direction. The missing pieces are almost all in the **backend logic, process, and data relationships**.

8. The Hard Truth (Different Angle Summary)

Servi-Gen is currently:

A beautiful empty house.

- The walls, doors, and paint look like Halo.
- Most rooms have no furniture, no electricity, and no plumbing.
- You can walk around and admire the design.
- You cannot live in it yet.

The deepest missing things are not more menu items. They are:

1. A real working Ticket object (with history, actions, relationships)
2. Process engines (Workflow, SLA, Approval, Automation)
3. Collaboration (notes, email, assignment)
4. Configurability
5. Data relationships between records

Until those exist, adding more screens will only make a prettier prototype.
